

LAB ASSIGNMENT – 12.5

NAME - SHREE PRIYA

2303A51465

BATCH – 29

Task Description #1 (Sorting – Merge Sort Implementation)

- Task: Use AI to generate a Python program that implements the Merge Sort algorithm.

- Instructions:

- o Prompt AI to create a function `merge_sort(arr)` that sorts a list in ascending order.

- o Ask AI to include time complexity and space complexity in the function docstring.

- o Verify the generated code with test cases.

- Expected Output:

- o A functional Python script implementing Merge Sort with proper documentation.

PROMPT - Generate a Python function `merge_sort(arr)` that sorts a list in ascending order using the Merge Sort algorithm and include time complexity and space complexity in the function docstring

CODE:

```
def merge_sort(arr):
```

```
    """
```

```
    Sorts a list using Merge Sort algorithm.
```

```
    Time Complexity: O(n log n)
```

```
    Space Complexity: O(n)
```

```
    """
```

```
    if len(arr) > 1:
```

```
        mid = len(arr) // 2
```

```
        left = arr[:mid]
```

```
        right = arr[mid:]
```

```
merge_sort(left)
merge_sort(right)
```

```
i = j = k = 0
```

```
while i < len(left) and j < len(right):
```

```
    if left[i] < right[j]:
```

```
        arr[k] = left[i]
```

```
        i += 1
```

```
    else:
```

```
        arr[k] = right[j]
```

```
        j += 1
```

```
    k += 1
```

```
while i < len(left):
```

```
    arr[k] = left[i]
```

```
    i += 1
```

```
    k += 1
```

```
while j < len(right):
```

```
    arr[k] = right[j]
```

```
    j += 1
```

```
    k += 1
```

```
return arr
```

```
# Example usage
```

```
arr = [38, 27, 43, 3, 9, 82, 10]
```

```
print("Sorted Array:", merge_sort(arr))
```

```
def merge_sort(arr):
    if len(arr) > 1:
        mid = len(arr) // 2
        left = arr[:mid]
        right = arr[mid:]

        merge_sort(left)
        merge_sort(right)

        i = j = k = 0

        while i < len(left) and j < len(right):
            if left[i] < right[j]:
                arr[k] = left[i]
                i += 1
            else:
                arr[k] = right[j]
                j += 1
            k += 1

        while i < len(left):
            arr[k] = left[i]
            i += 1
            k += 1

        while j < len(right):
            arr[k] = right[j]
            j += 1
            k += 1

    return arr

# Example usage
arr = [38, 27, 43, 3, 9, 82, 10]
print("Sorted Array:", merge_sort(arr))
```

PROBLEMS OUTPUT TERMINAL PORTS

TERMINAL

```
PS C:\Users\Shree priya\Downloads> & 'C:\Users\Shree priya\AppData\Local\Microsoft\WindowsApps\python3.13.exe' "c:\py-2025.10.0-win32-and-bundled\libs\debugpy\launcher" "52383" -" "C:\Users\Shree priya\Downloads\aac12.5.py"
Sorted Array: [3, 9, 10, 27, 38, 43, 82]
PS C:\Users\Shree priya\Downloads>
```

Justification:

Merge Sort is an efficient divide-and-conquer sorting algorithm. It splits the list into smaller sublists and merges them in sorted order. It guarantees $O(n \log n)$ time complexity and works well for large datasets.

Task Description #2 (Searching – Binary Search with AI Optimization)

- Task: Use AI to create a binary search function that finds a target element in a sorted list.
- Instructions:
 - o Prompt AI to create a function `binary_search(arr, target)` returning the index of the target or -1 if not found.
 - o Include docstrings explaining best, average, and worst-case complexities.
 - o Test with various inputs.
- Expected Output:

o Python code implementing binary search with AI-

generated comments and docstrings

PROMPT - # "Generate a Python function `binary_search(arr, target)` that searches for a target element in a sorted list and returns its index or -1 if not found, including docstrings explaining best, average, and worst-case time complexities

CODE:

```
def binary_search(arr, target):
```

```
    """
```

```
    Performs Binary Search on a sorted list.
```

```
    Best Case Complexity:  $O(1)$  -> when target is found at the middle.
```

```
    Average Case Complexity:  $O(\log n)$ 
```

```
    Worst Case Complexity:  $O(\log n)$ 
```

```
    Returns:
```

```
    Index of target if found, otherwise -1.
```

```
    """
```

```
    left = 0
```

```
    right = len(arr) - 1
```

```
    while left <= right:
```

```
        mid = (left + right) // 2
```

```
        if arr[mid] == target:
```

```
            return mid
```

```
        elif arr[mid] < target:
```

```
            left = mid + 1
```

```
        else:
```

```
            right = mid - 1
```

```
    return -1
```

Test Cases

```
arr = [2, 5, 8, 12, 16, 23, 38]
```

```
print(binary_search(arr, 12)) # Output: 3
```

```
print(binary_search(arr, 5)) # Output: 1
```

```
print(binary_search(arr, 20)) # Output: -1
```

```
def binary_search(arr, target):
    """
    Performs Binary Search on a sorted list.

    Best Case Complexity: O(1) -> when target is found at the middle.
    Average Case Complexity: O(log n)
    Worst Case Complexity: O(log n)

    Returns:
    Index of target if found, otherwise -1.
    """
    left = 0
    right = len(arr) - 1

    while left <= right:
        mid = (left + right) // 2

        if arr[mid] == target:
            return mid
        elif arr[mid] < target:
            left = mid + 1
        else:
            right = mid - 1

    return -1

# Test Cases
arr = [2, 5, 8, 12, 16, 23, 38]

print(binary_search(arr, 12)) # Output: 3
print(binary_search(arr, 5)) # Output: 1
print(binary_search(arr, 20)) # Output: -1
```

The screenshot shows a code editor with a dark theme. The code is a Python function for binary search. Below the function, there are test cases. The terminal output at the bottom shows the results of these test cases: 3, 1, and -1.

Justification:

Binary Search is efficient for searching elements in a **sorted list**. It repeatedly divides the list into halves until the target element is found. This reduces the search time to **$O(\log n)$** , making it faster than linear search.

Task Description #3: Smart Healthcare Appointment Scheduling System

A healthcare platform maintains appointment records containing

appointment ID, patient name, doctor name, appointment time, and consultation fee. The system needs to:

1. Search appointments using appointment ID.
2. Sort appointments based on time or consultation fee.

Student Task

- Use AI to recommend suitable searching and sorting algorithms.
- Justify the selected algorithms.
- Implement the algorithms in Python.

PROMPT - Generate a Python program for a Smart Healthcare Appointment Scheduling System that stores appointment ID, patient name, doctor name, appointment time, and consultation fee, uses Binary Search to find appointments by ID, and uses Merge Sort to sort appointments by time or consultation fee with proper comments and explanations.

Smart Healthcare Appointment Scheduling System

CODE:

Appointment records

```
appointments = [  
    {"id":101, "patient":"Ravi", "doctor":"Dr.Kumar", "time":10, "fee":500},  
    {"id":102, "patient":"Anita", "doctor":"Dr.Rao", "time":12, "fee":300},  
    {"id":103, "patient":"Sita", "doctor":"Dr.Mehta", "time":9, "fee":700},  
    {"id":104, "patient":"Rahul", "doctor":"Dr.Sharma", "time":11, "fee":400}  
]
```

Binary Search to find appointment by ID

```
def binary_search(arr, target):
```

```
    left = 0
```

```
    right = len(arr) - 1
```

```
    while left <= right:
```

```
        mid = (left + right) // 2
```

```
        if arr[mid]["id"] == target:
```

```
        return arr[mid]
    elif arr[mid]["id"] < target:
        left = mid + 1
    else:
        right = mid - 1

    return "Appointment not found"
```

Merge Sort to sort appointments

```
def merge_sort(arr, key):
    if len(arr) <= 1:
        return arr

    mid = len(arr) // 2
    left = merge_sort(arr[:mid], key)
    right = merge_sort(arr[mid:], key)

    result = []
    i = j = 0
```

```
    while i < len(left) and j < len(right):
        if left[i][key] < right[j][key]:
            result.append(left[i])
            i += 1
        else:
            result.append(right[j])
            j += 1
```

```
    result.extend(left[i:])
    result.extend(right[j:])
    return result
```

```
# Sort appointments by time
```

```
sorted_time = merge_sort(appointments, "time")
```

```
print("Sorted by Time:", sorted_time)
```

```
# Sort appointments by consultation fee
```

```
sorted_fee = merge_sort(appointments, "fee")
```

```
print("Sorted by Fee:", sorted_fee)
```

```
# Search appointment by ID
```

```
appointments_sorted_by_id = sorted(appointments, key=lambda x: x["id"])
```

```
result = binary_search(appointments_sorted_by_id, 103)
```

```
print("Search Result:", result)
```

```
14 def binary_search(arr, target):
15     if len(arr) == 0:
16         return "Appointment not found"
17     return arr
18
19 # Merge sort to sort appointments
20 def merge_sort(arr, key):
21     if len(arr) <= 1:
22         return arr
23
24     mid = len(arr) // 2
25     left = merge_sort(arr[:mid], key)
26     right = merge_sort(arr[mid:], key)
27
28     result = []
29     i = j = 0
30
31     while i < len(left) and j < len(right):
32         if left[i][key] < right[j][key]:
33             result.append(left[i])
34             i += 1
35         else:
36             result.append(right[j])
37             j += 1
38
39     result.extend(left[i:])
40     result.extend(right[j:])
41     return result
42
43 # Sort appointments by time
44 sorted_time = merge_sort(appointments, "time")
45 print("Sorted by Time:", sorted_time)
46

```
Sorted by Fee: [{'id': 102, 'patient': 'Anita', 'doctor': 'Dr.Rao', 'time': 12, 'fee': 300}, {'id': 104, 'patient': 'Rahul', 'doctor': 'Dr.Sharma', 'time': 11, 'fee': 400}, {'id': 101, 'patient': 'Ravi', 'doctor': 'Dr.Ramar', 'time': 10, 'fee': 500}, {'id': 103, 'patient': 'Sita', 'doctor': 'Dr.Mehta', 'time': 9, 'fee': 700}]
Search Result: {'id': 103, 'patient': 'Sita', 'doctor': 'Dr.Mehta', 'time': 9, 'fee': 700}
PS C:\Users\Shree priya\Downloads>
```

Justification:

Binary Search is used to quickly find appointments using **appointment ID** in sorted records. Merge Sort efficiently organizes appointments based on **time or consultation fee**. These algorithms improve system performance when handling large appointment datasets.

Task Description #4: Railway Ticket Reservation System

Scenario

A railway reservation system stores booking details such as ticket

ID, passenger name, train number, seat number, and travel date. The

system must:

1. Search tickets using ticket ID.
2. Sort bookings based on travel date or seat number.

Student Task

- Identify efficient algorithms using AI assistance.
- Justify the algorithm choices.
- Implement searching and sorting in Python

PROMPT - Generate a Python program for a Railway Ticket Reservation System that stores ticket ID, passenger name, train number, seat number, and travel date, uses Binary Search to find tickets by ticket ID, and uses Merge Sort to sort bookings by travel date or seat number with proper comments and documentation

Railway Ticket Records

41
42 # Initial data
43 allocations = [
44     {"student_id": 101, "room": 101, "floor": 1, "date": "2020-01-01"},
45     {"student_id": 102, "room": 102, "floor": 1, "date": "2020-02-25"},
46     {"student_id": 103, "room": 103, "floor": 1, "date": "2020-03-05"},
47     {"student_id": 104, "room": 104, "floor": 1, "date": "2020-02-28"},
48     {"student_id": 105, "room": 105, "floor": 1, "date": "2020-03-05"}
49 ]
50
51 # Sort by Allocation Date
52 sorted_date = merge_sort(allocations, "date")
53
54 # Search allocation by student ID
55 allocations_sorted = sorted(allocations, key=lambda x: x["student_id"])
56
57 # Print results
58 print("Sorted by Allocation Date:", sorted_date)
59 print("Search Result:", binary_search(allocations_sorted, 103))

```

Justification:

Binary Search efficiently finds student allocation details using **student ID**. Merge Sort organizes records by **room number or allocation date**. This improves data management and retrieval in hostel systems.

Task Description #6: Online Movie Streaming Platform

A streaming service maintains movie records with movie ID, title, genre, rating, and release year. The platform needs to:

1. Search movies by movie ID.
2. Sort movies based on rating or release year.

Student Task

- Recommend searching and sorting algorithms using AI.
- Justify the chosen algorithms.
- Implement Python functions

PROMPT - Generate a Python program for an Online Movie Streaming Platform that stores movie ID, title, genre, rating, and release year, uses Binary Search to find movies by movie ID, and uses Merge Sort to sort movies by rating or release year with proper comments

CODE:

```
# Movie records
```

```
movies = [  
    {"id":1, "title":"Inception", "genre":"Sci-Fi", "rating":8.8, "year":2010},  
    {"id":2, "title":"Avatar", "genre":"Action", "rating":7.8, "year":2009},  
    {"id":3, "title":"Interstellar", "genre":"Sci-Fi", "rating":8.6, "year":2014},  
    {"id":4, "title":"Titanic", "genre":"Romance", "rating":7.9, "year":1997}  
]
```

```
# Binary Search by Movie ID
```

PROBLEMS OUTPUT TERMINAL PORTS

28 Sorted by Release Year: [{'id': 4, 'title': 'Titanic', 'genre': 'Romance', 'rating': 7.9, 'year': 1997}, {'id': 2, 'title': 'Avatar', 'genre': 'Action', 'rating': 7.8, 'year': 2009}, {'id': 1, 'title': 'Inception', 'genre': 'Sci-Fi', 'rating': 8.8, 'year': 2010}, {'id': 3, 'title': 'Interstellar', 'genre': 'Sci-Fi', 'rating': 8.6, 'year': 2014}]

Search Result: {'id': 3, 'title': 'Interstellar', 'genre': 'Sci-Fi', 'rating': 8.6, 'year': 2014}

PS C:\Users\Shree priya\Downloads>

Justification:

Binary Search helps quickly search movie records using **movie ID**. Merge Sort is suitable for arranging movies by **rating or release year**. These algorithms allow efficient handling of large movie databases.

Task Description #7: Smart Agriculture Crop Monitoring System

An agriculture monitoring system stores crop data with crop ID, crop name, soil moisture level, temperature, and yield estimate. Farmers need to:

1. Search crop details using crop ID.
2. Sort crops based on moisture level or yield estimate.

Student Task

- Use AI-assisted reasoning to select algorithms.
- Justify algorithm suitability.
- Implement searching and sorting in Python

PROMPT - Generate a Python program for a Smart Agriculture Crop Monitoring System that stores crop ID, crop name, soil moisture level, temperature, and yield estimate, uses Binary Search to find

crops by crop ID, and uses Merge Sort to sort crops by moisture level or yield estimate with proper comments.

```
# Crop data records
```

```
crops = [
